Apple Hardware Test (AHT)

Description

Apple computers ship with a pre-installed suite of hardware diagnostic tools, known as Apple Hardware Test (AHT). In principle you can start them by holding the `d` key while booting. Newer models support holding `option d` to load AHT over the internet. Refer to the official Apple documentation for details: [Using AHT on Intel-based Macs, Mountain Lion, and Mavericks](#). Apple redesigned the AHT, now called [Apple Diagnostics](#), for Macs introduced after June 2013.

If however, you reinstalled an older computer from scratch, the diagnostic tools might no longer be available. Unless you have the original disks that came with your computer, there seems to be no way to restore the AHT, as the [official AHT](#) page only contains information about ancient computer models.

It happens that Apple provides disk images with AHT for most computers, but does not make the links publicly available. Various blogs and forums, mostly [Riven by Five](#) and [MacForum.ro](#) have gathered a list of download links. The rest were obtained by scraping `http://download.info.apple.com/Apple_Hardware_Test/` for all the links of the form `0{18|22}-\d{4}-A.dmg`.

Even though there's no guarantee that this list is correct or complete, some links can come in very handy to whoever is trying to debug hardware problems.

You can use the following terminal commands to determine the model and board ID of your computer:

```
system_profiler SPHardwareDataType | grep 'Model Identifier' | awk -F: '{ print $2 }'  
ioreg -l | grep board-id | awk -F\" '{ print $4 }'
```

If your Mac was made after December 2013, your Mac will load Apple Diagnostics. This tool is functionally similar to Apple Hardware Test, but instead of the retro macOS look, it feels like you never quite left the boot screen.. Understand that every computing device, may it be your desktop computer, laptop, or mobile phone, consists of both hardware and software components.
